Starter P Project Collaborators

Participating producers:
Jerry Blumer (Weedsport); Randy Brouillette (Waterville); Bill Brown (Hammondsport); Ken Burr (Searsburg); Timothy Cantwell (Richfield Springs); Greg Coller (Dekalb); Clark Decker (Stockholm); Dave Fisher (Madrid); Dudley French; (Chemung); Gary Gaige (Mecklenburg); Jon Greenwood (Canton); Greenwich Central School Ag Class with help from Bill Elsworth (Greenwich); Mark Grocott (Edmeston); Les Hargrave (Depeyster); Paul, Tim, and Mark Heiden (Madrid); Hendee Homestead Farm (Hornell); Rick Holdridge (Bloomville); John Hourigan (Elbridge); Wilfred Hughson (Jeffersonville); Mark Jahake (Cherry Valley and Cooperstown); Bill Kilter (Genoa); Lou Ann King (Madrid); David and Andrew Kross (Earlville); Frank Lamport (Hobart); Ralph Lott (Seneca Falls); John Maxwell (Lakeville); Kevin McCollum (Canton); Mike McMahon (Homer); Tom Moskin (Ava); Steve and Gary Natali (East Springfield; Cooperstown); Steve Nemec (New Hope); Ken Pemberton (Lisbon); David Post (Stamford); Charlie Roberts (Fort Jackson); Dave Schieferstine (Westmoreland); Joe and Kirk Schwansick (Little Falls); Maurice Stoughton (Newark Valley); Sykes Dairy Farms (North Branch); Richard and Steve Talcott (Aurora); Glenn and Larry Taylor (Cassville); Gary Teel (W. Barneveld); Gary Tiernan (Waddington, Chase Mills); John Williams (Carthage); Rob Williams (Waterville); Wayne Wood (Northumberland & Saratoga); Marty Young (Cuyler).

Participating Cornell Cooperative Extension educators:
Carl Albers (Steuben Co), Pete Barney (St. Lawrence Co), Shawn Bossard (Cayuga Co), Peter Carey (Sullivan Co), Janice Degni (CCTTS Area Extension Specialist), Mike Dennis (Seneca Co), Dale Dewing (Delaware Co), Aaron Gabriel (Washington Co), Kevin Ganoe (Mohawk Region Area Extension Specialist), Nate Herendeen (NWNY Area Extension Specialist), Mike Hunter (Jefferson & Lewis Co), Dayton Maxwell (Saratoga Co), Jeff Miller (Oneida Co), Mike Stanyard (NWNY Dairy Livestock & Field Crops Team).

Other participants:
Elaine Dalrymple (Schuyler Co SWCD), Mike Davis (Willisboro Research Farm), Dr. Alam Khan (Morrisville Technical College), Mark Ochs (consultant), Dr. Greg Roth (Penn State), Ron Stutzman (Stutzman’s Research Farm), Ev Thomas (Miner Institute).

Sponsors:
This project is sponsored by a research and extension grant from NE SARE. Other contributors include: NY NRCS, Northern NY Agricultural Development Program, Agway’s Lyon blend plant, Carovail, Pioneer Hi-Bred International Inc. and AgriCulver Seeds.

Starter P Project Trials

To evaluate and demonstrate the value of phosphorus (P) starter application on soils testing High or Very High for soil P, we initiated a state-wide, on-farm starter P project in 2000. These past four years, 75 on-farm trials and 13 research station trials were established and evaluated.

Figure 1: Starter P trial sites (2001-2003).

On-farm Demonstration Trials

Trials were established on farmer fields testing high or very high for P (>8 lbs Phosphate Morgan).

From 2001 onwards, the majority of sites had four treatments:
• No starter.
• No P in the starter (N+K only).
• Low or recommended P in the starter (10 - 25 lbs P₂O₅).
• Producer’s starter blend and rate.

Most treatments in 2002 and all treatments in 2003 were replicated at least two times. Most trials in 2000 and 2001 were unreplicated. Soil samples were taken for analysis from each plot at planting time and at PSNT time when corn reached 612 inches. Planting date, soil temperature at planting, field history (e.g., crop sequences and manure rates), and plant population were noted to aid in final data analysis and evaluation of results. Plots were harvested for corn silage or grain corn.

Field days were held at several locations (Figure 2). Audiences were asked to identify differences in corn growth with each of the four treatments and generally agreed that there were no visual P deficiency effects or growth differences.

Replicated Research Trials

Research station trials were carried out in four replicates in 2001, 2002, and 2003. Locations included Aurora, Morrisville Technical College (2002 and 2003), Willsboro Research Farm, Batavia Research Facility (2001 only), Stutzman’s Research Farm (2002 only).

Four treatments were established at the research sites:
- No starter.
- No P in the starter (200 lbs of 10-0-10).
- 20 lbs of P₂O₅ (200 lbs of 10-10-10) in the starter.
- 40 lbs of P₂O₅ (200 lbs of 10-20-10) in the starter.

Also at the research station field days, participants were unable to identify the different treatments (Figure 3).

Results

Yields of the on-farm trials and on-station trials showed no significant response to P application on soils testing high or very high in P in 2001 and 2002. The 2003 results suggest a response to a small amount of starter P (<25 lbs P₂O₅/acre). No additional yield was obtained with higher amounts. Analysis of the combined 3-year average allowed us to check if responses were different with early planting versus late planting, with soils testing high in P versus very high, and on manured fields versus fields that had not received manure recently. The soil test classification (high or very high) impacted the results; for fields testing high in P, an increase in yield was seen with a modest P application (<25 lbs P₂O₅/acre) while for fields that were very high in P, yields responded to starter N (+K) only (Table 1). At the research station trials, there were no significant yield differences due to P applications at any of the locations in any of the years trials were conducted.

Conclusions

Based on the results of the past three years, we conclude that on sites that test high in P and have no manure applications planned for the season, no yield penalty is expected when P starter levels are reduced below 25 lbs P₂O₅/acre. The results confirm the P fertilizer guidelines shown in Figure 4. On sites that test very high in P or when manure is applied to high testing sites, there is a low probability of a starter P response and P could be eliminated from the starter without a yield penalty (Table 2). Corn responds to N in the starter band more often than P and we continue to recommend 20-30 lbs of banded starter N, even where P is eliminated.
