1. General Survey Summary

Chautauqua County is the southwestern most county in New York State. It is bordered by Pennsylvania on the southern and western sides and by Lake Erie on the north. Chautauqua County was named after its largest lake, which was called “Jad-dad-gwah” by the Seneca Indians. The lake is 20 miles long and is 1,308 feet above sea level, which makes it one of the highest navigable freshwater inland lakes in the United States. Just over one third of the county’s 679,690 acres are in farm production.

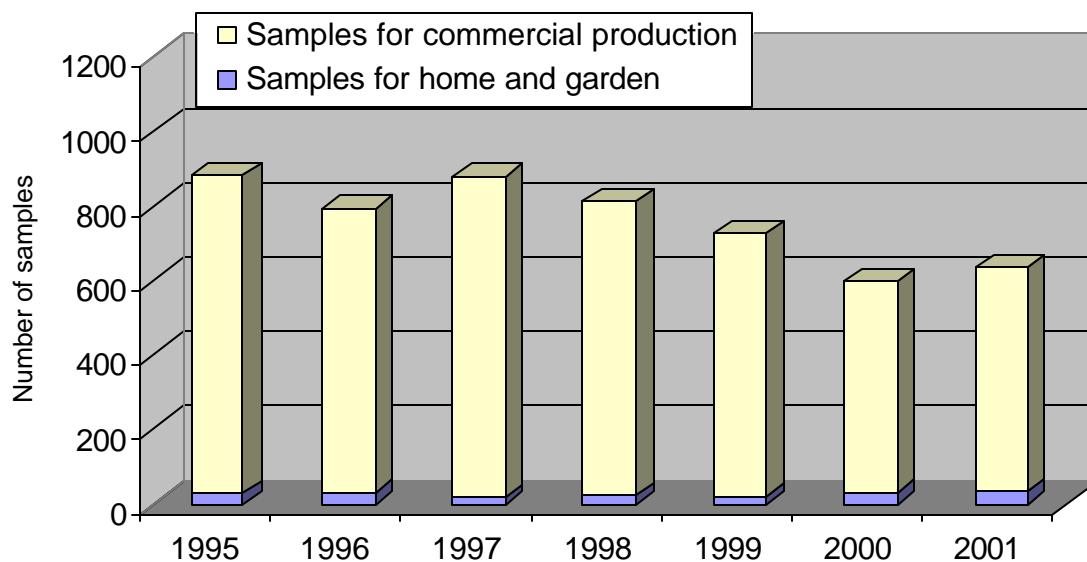

Two different farming enterprises are supported in the county as a result of two different physiographic providences in the county. The Erie-Ontario Plain is a belt 2 to 6 miles wide along Lake Erie ranging in elevation from 572 feet at the base of Lake Erie to about 850 feet at the base of the bordering escarpment. The Allegany Plateau covers the remaining 80 percent of the county. Elevations in the Plateau area range from 1,300 feet in the valleys to 2,100 feet. Less than 2,000 acres in the southeastern corner of the county are the only acres of the county that were not covered by ice at some point during the glacial period. This area also includes the highest point in the county at 2,190 feet.

The main agriculture enterprise in the Plain area is grape production; however, substantial areas are used for vegetables, orchard crops, or small fruits, as well as dairy production. Chautauqua County is the leading County for grape production in New York State. The Plateau region focuses mainly on corn and hay crops for the main agricultural enterprise of dairy farming. Chautauqua County ranks in the top ten counties of New York for production of grapes, peaches, sweet cherries, tomatoes, milk production, and beef cows.

This survey summarizes the soil test results from Chautauqua County soil samples submitted for analyses to the Cornell Nutrient Analysis Laboratory (CNAL) during 1995-2001. The total number of samples analyzed in these years was 5322. Of these, 5135 samples (96%) were submitted to obtain fertilizer recommendations for commercial production while 187 samples (4%) were submitted as home and garden samples.

Most of the home and garden samples submitted during the period 1995-2001 were submitted to request fertilizer recommendations for lawns (33%) or vegetable production

(27%). People submitting samples for commercial production requested fertilizer recommendations for grapes (27%), corn silage or grain (24%), hay production (18%), or alfalfa, alfalfa/grass or alfalfa/trefoil mixtures (11%), while a few producers were planning on growing other crops including clover/grass mixtures, birdsfoot trefoil, beans, oats and tomatoes.

Homeowners		Commercial		Total
1995	29	1995	852	881
1996	33	1996	761	794

Total	187	Total	5135	5322

Home and garden samples in Chautauqua County were mostly silt or sandy loams belonging to soil management groups 3 (43%) and 4 (33%). Eighteen percent belonged to soil management group 2. Group 5 was represented by 6% of all samples. The table below gives descriptions of each of the soil management groups.

Soil Management Groups for New York

1	Fine-textured soils developed from clayey lake sediments and medium- to fine-textured soils developed from lake sediments.
2	Medium- to fine-textured soils developed from calcareous glacial till and medium-textured to moderately fine-textured soils developed from slightly calcareous glacial till mixed with shale and medium-textured soils developed in recent alluvium.
3	Moderately coarse textured soil developed from glacial outwash and recent alluvium and medium-textured acid soil developed on glacial till.
4	Coarse- to medium-textured soils formed from glacial till or glacial outwash.
5	Coarse- to very coarse-textured soils formed from gravelly or sandy glacial outwash or glacial lake beach ridges or deltas.
6	Organic or muck soils with more than 80% organic matter.

Of the samples submitted for commercial production, 74% belonged to soil management group 3. Eighteen percent were from soil management group 2 while 5% were classified group 4. Only one percent of the samples belonged to soil management group 1. The five most common soil series were Chenango (19%), Busti (8%), Fremont (8%), Chautauqua (6%), and Volusia (5%). These soils represent 5.6% (Chenango), 17.0% (Busti), 12.8% (Fremont), 12.5% (Chautauqua), and 2.3% (Volusia) of the total 679,690 acres in the county.

Organic matter levels, as measured by loss on ignition, ranged from less than 1% to a little over 17% with median values ranging from 4.4 to 5.9% organic matter for home and garden samples and values ranging from 4.2 to 4.7% organic matter for samples submitted for commercial production. Fifty percent of the home and garden samples had between 2 and 5% organic matter with 11% testing between 2 and 2.9% organic matter, 20% between 3.0 and 3.9% organic matter and 19% between 4.0 and 4.9% organic matter. Forty eight percent of the soils submitted for home and garden tested >4.9% in organic matter. Of the samples submitted for commercial production, 24% contained

Ketterings, Q.M., H. Krol, W.S. Reid and D. Sprague (2003). Chautauqua County Soil Sample Survey 1995-2001. CSS Extension Bulletin E03-12. 39 pages.

between 3 and 4% organic matter, 33% tested between 4.0 and 4.9% while 24% had organic matter concentrations of 5.0-5.9%. In total, 63% of the samples had organic matter levels between 4.0 and 6.9%.

Soil pH in water (1:1 extraction ratio) varied from pH 3.4 to 10 with the median for home and garden samples ranging from pH 5.7 to pH 6.6 and for samples submitted for commercial production ranging from pH 5.9 to pH 6.0. Of the home and garden samples, 54% tested between pH 6.0 and 7.4. For the samples submitted for commercial production, this was 50% while 33% tested between pH 5.0 and 5.9.

Extractable nutrients such as phosphorus (P), potassium (K), magnesium (Mg), calcium (Ca), iron (Fe), manganese (Mn), and zinc (Zn) were measured using the Morgan solution and extraction method (Morgan, 1941). This solution contains sodium acetate buffered at a pH of 4.8.

Soil test P levels of <1 lbs P/acre are classified as very low. Between 1-3 lbs P/acre is low. Medium is between 4-8 lbs P/acre. High testing soils have P levels between 9 and 39 lbs P/acre and soils with >39 lbs P/acre are classified as very high. Of the home and garden samples, 17% tested low, 27% tested medium, 30% tested high and 26% tested very high. This meant that 56% tested high or very high in P. Phosphorus levels for samples for commercial production in Chautauqua County lower than the state average (in New York about 50% tested high or very high in P in 1995-2001). Only one percent of the samples tested very high in P. Thirty eight percent were low in P, 30% tested medium for P while 31% of the submitted samples were classified as high in soil test P. This means that 32% tested high or very high in P. There were no clear trends in P levels over the 6 years.

Classifications for potassium depend on soil management group. The fine-textured soils of soil management group 1 have a greater K supplying capacity than the coarse textured sandy soils (soil management group 5). Classification for each of the management groups in the above table represent very low, low, medium, high and very high. So for example for soil management group 5 and 6, <60 lbs K/acre means the soil is very low in K, between 60 and 114 lbs K/acre is low, 115-164 lbs K/acre is medium, 165-269 lbs K/acre is high and >269 lbs K/acre is classified as very high (see the table below).

Ketterings, Q.M., H. Krol, W.S. Reid and D. Sprague (2003). Chautauqua County Soil Sample Survey 1995-2001. CSS Extension Bulletin E03-12. 39 pages.

Potassium classifications depend on soil test K levels and soil management group.

Soil Management Group	Potassium Soil Test Value (Morgan extraction in lbs K/acre)				
	Very low	Low	Medium	High	Very High
1	<35	35-64	65-94	95-149	>149
2	<40	40-69	70-99	100-164	>164
3	<45	45-79	80-119	120-199	>199
4	<55	55-99	100-149	150-239	>239
5 and 6	<60	60-114	115-164	165-269	>269

Of the home and garden samples, 7% was classified as very low or low in potassium. Thirteen percent tested medium, 25% were high and 55% of the samples were very high in potassium. For samples submitted for commercial production, 1% tested very low in K, 8% tested low, 18% tested medium, 32% tested high and 40% tested very high in potassium. As with phosphorus, there were no trends over the 6 years of soil sampling.

Soils test very low for magnesium if Morgan extractable Mg is less than 20 lbs Mg/acre. Low testing soils have 20-65 lbs Morgan Mg per acre. Soils with 66-100 lbs Mg/acre test medium for magnesium. High testing soils have 101-199 lbs Mg/acre while soils with more than 200 lbs Mg/acre in the Morgan extraction are classified as very high in Mg. Magnesium levels ranged from 41 to a little over 4000 lbs Mg/acre (Morgan extraction). There were only very few samples that tested very low in Mg. Most soils tested high or very high for Mg (96% of the homeowner soils and 90% of the soils of the commercial growers). No more than 7 of the homeowner soils and 9% of the commercial growers' soil tested low or medium in Mg.

Soils with more than 50 lbs Morgan extractable Fe per acre test excessive for Fe. Anything lower than 50 lbs Fe/acre is considered normal. Iron levels fell for 86-77% in the normal range with 14% of the home and garden samples and 23% of the samples for commercial production testing excessive for Fe. Most soils (95-97%) for both groups tested normal for manganese. Soils with more than 100 lbs Morgan extractable Mn per acre are classified as excessive in Mn. Anything less than 100 lbs Mn per acre is

Ketterings, Q.M., H. Krol, W.S. Reid and D. Sprague (2003). Chautauqua County Soil Sample Survey 1995-2001. CSS Extension Bulletin E03-12. 39 pages.

classified as normal. Soils with less than 0.5 lbs Zinc per acre in the Morgan extraction are classified as low in Zn. Medium testing soils have between 0.5 and 1 lbs of Morgan extractable Zn per acre. If more than 1 lbs of Zn/acre is extracted with the Morgan solution, the soil tests high in Zn. For the home and garden samples, 90% tested high for zinc while 9% tested medium and 1% was low in Zn. Of the samples for commercial production, 2% tested low in zinc, 19% tested medium while 79% was high in zinc.

In the following sections, the summary tables for each of the soil fertility indicators described above are given. The appendix contains the crop codes used in section 2.

Appendix: Cornell Crop Codes

Crop codes are used in the Cornell Nutrient Analyses Laboratory.

Crop Code	Crop Description
	Alfalfa
ABE	Alfalfa trefoil grass, Establishment
ABT	Alfalfa trefoil grass, Established
AGE	Alfalfa grass, Establishment
AGT	Alfalfa grass, Established
ALE	Alfalfa, Establishment
ALT	Alfalfa, Established
	Birdsfoot
BCE	Birdsfoot trefoil clover, Establishment
BCT	Birdsfoot trefoil clover, Established
BGE	Birdsfoot trefoil grass, Establishment
BGT	Birdsfoot trefoil grass, Established
BSE	Birdsfoot trefoil seed, Establishment
BST	Birdsfoot trefoil seed, Established
BTE	Birdsfoot trefoil, Establishment
BTT	Birdsfoot trefoil, Established
	Barley
BSP	Spring barley
BSS	Spring barley with legumes
BUK	Buckwheat
BWI	Winter barley
BWS	Winter barley with legumes
	Clover
CGE	Clover grass, Establishment
CGT	Clover grass, Established
CLE	Clover, Establishment
CLT	Clover, Established
CSE	Clover seed production, Establishment
CST	Clover seed production, Established

Crop Code	Crop Description
	Corn
COG	Corn grain
COS	Corn silage
	Grasses, pastures, covercrops
GIE	Grasses intensively managed, Establishment
GIT	Grasses intensively managed, Established
GRE	Grasses, Establishment
GRT	Grasses, Established
PGE	Pasture, Establishment
PGT	Pasture improved grasses, Established
PIE	Pasture intensively grazed, Establishment
PIT	Pasture intensively grazed, Established
PLE	Pasture with legumes, Establishment
PLT	Pasture with legumes, Established
PNT	Pasture native grasses
PNE	Pasture native grasses, Established
RYC	Rye cover crop
RYS	Rye seed production
TRP	Triticale peas
	Small grains
MIL	Millet
OAS	Oats with legume
OAT	Oats
SOF	Sorghum forage
SOG	Sorghum grain
SOY	Soybeans
SSH	Sorghum sudan hybrid
SUD	Sudangrass
WHS	Wheat with legume
WHT	Wheat
	Others
ALG	Azalea
APP	Apples
ATF	Athletic Field

Crop Code	Crop Description
APP	Apples
ASP	Asparagus
BDR/BND	Beans-dry
BKB	Blackberries
BLU/BLB	Blueberries
BNS	Beans, Snap
CBP	Cabbage, Transplanted
CBS	Cabbage, Seeded
CEM	Cemetery
CKP	Cucumber, Transplanted
END	Endives
FAR	Fairway
FLA	Flowering Annuals
GPA	Grapes, American
GPF	Grapes, French-American
GPV	Grapes, Vinifera
GRA	Grapes
GEN	Green
HRB	Herbs
IDL	Idle land
LAW	Lawn
LET	Lettuce
MIX/MVG	Mixed vegetables
MML	Muskmelon
NUR	Nursery
ONS	Onion-seeded
OTH	Other
PAR	Pears
PCH	Peach
PER	Perennials
POP	Popcorn
PRK	Park
POT/PTO	Potatoes
PUM	Pumpkins
RAD	Radishes
ROD	Roadside
ROS	Roses
ROU	Rough
RSF	Raspberries, Fall

Crop Code	Crop Description
RSP	Raspberries (homeowners)
RSS	Raspberries, Summer
SAG	Ornamentals adapted to pH 6.0 to 7.5
SQS	Squash, Summer
SQW	Squash, Winter
STE	Strawberries, Ever
STR	Strawberries (homeowners)
STS	Strawberries, Spring
SUN	Sunflowers
SWC	Sweet corn
TOM	Tomatoes
TME	Tomato, Early
TRE	Christmas trees, Established
TRF	Tree fruits
TRT	Christmas trees, Topdressing
WAT	Watermelon
