1. General Survey Summary

This survey summarizes the soil test results from Franklin County soil samples submitted for analyses to the Cornell Nutrient Analysis Laboratory (CNAL) during 1995-2001. The total number of samples analyzed in these years amounted to 1784. Of these 1728 samples (97%) were submitted to obtain fertilizer recommendations for commercial production while 56 samples (3%) was submitted as home and garden samples.

Homeowners		Commercial		Total	
1995	4	1995	171	1995	175
1996	3	1996	187	1996	190
1997	13	1997	261	1997	274
1998	4	1998	272	1998	276
1999	15	1999	379	1999	394
2000	9	2000	285	2000	294
<u>2001</u>	<u>8</u>	<u>2001</u>	<u>173</u>	<u>2001</u>	<u>181</u>
Total	56	Total	1728		1784

Ketterings, Q.M., H. Krol, W.S. Reid and C. Tillinghast (2003). Franklin County Soil Sample Survey 1995-2001. CSS Extension Bulletin E03-11. 37 pages.

Of the 56 home and garden samples submitted in the 6 year period, 14 samples were submitted to request fertilizer recommendations for mixed vegetable production and 9 (16%) were lawn samples. People submitting samples for commercial production requested fertilizer recommendations to grow alfalfa or alfalfa/grass mixtures (27%), corn silage or grain (26%), grass hay (21%) while a few producers were planning on growing other crops including clover-grass mixtures, pasture, potatoes, soybeans, mixed vegetables and Christmas trees. Home and garden samples in Franklin County were mostly sandy (25 samples), silt loam (15 samples) or sandy loam soils (10 samples). The table below gives descriptions of each of the soil management groups.

Soil Management Groups for New York

1	Fine-textured soils developed from clayey lake sediments and medium- to fine-textured soils developed from lake sediments.
2	Medium- to fine-textured soils developed from calcareous glacial till and medium-textured to moderately fine-textured soils developed from slightly calcareous glacial till mixed with shale and medium-textured soils developed in recent alluvium.
3	Moderately coarse textured soil developed from glacial outwash and recent alluvium and medium-textured acid soil developed on glacial till.
4	Coarse- to medium-textured soils formed from glacial till or glacial outwash.
5	Coarse- to very coarse-textured soils formed from gravelly or sandy glacial outwash or glacial lake beach ridges or deltas.
6	Organic or muck soils with more than 80% organic matter.

Of the samples submitted for commercial production, 65% belonged to soil management group 4. Seventeen percent belonged to group 5, while group 1, 2, and 3 were represented with 11, 3, and 1%, respectively. The five most common soil series were Empeyville (24%), Adams (6%), Coveytown (5%), Madalin (5%) and Westbury (5%). These soils represent 7.8% (Empeyville), 3.4% (Adams), 1.3% (Coveytown), 1.8% (Madalin) and 3.4% (Westbury) of the total 310,000 acres (177,600 acres of farmland) in the county.

Ketterings, Q.M., H. Krol, W.S. Reid and C. Tillinghast (2003). Franklin County Soil Sample Survey 1995-2001. CSS Extension Bulletin E03-11. 37 pages.

Organic matter levels, as measured by loss on ignition, ranged from less than 1% to a little less than 30%. A few homeowner samples submitted in 1995 showed an organic matter level of 30% or higher. These samples were most likely potting soils rather than natural mineral soils. Of the home and garden samples 50% tested between 2 and 5% organic matter. The average (excluding the high organic matter samples submitted in 1995) ranged from 3.2% organic matter in 1997 to 5.1% in 1998 and 2001. Twenty nine percent of the soils submitted for home and garden tested higher than 4.9% organic matter. Of the samples submitted for commercial production, 60% contained between 3 and 4% organic matter and 27% tested between 4.0 and 4.9%. The average organic matter content ranged from 3.6% in 1999 to 4.2% in 1995. In total, 80% of the samples had organic matter levels between 2 and 5%.

Soil pH in water (1:1 extraction ratio) varied from pH 3.8 to 8.0. Of the home and garden samples, 66% tested between pH 6.0 and 7.4. For the samples submitted for commercial production, this was 77% while 22% tested between pH 5.0 and 5.9

Extractable nutrients such as phosphorus (P), potassium (K), magnesium (Mg), calcium (Ca), iron (Fe), manganese (Mn), and zinc (Zn) were measured using the Morgan solution and extraction method (Morgan, 1941). This solution contains sodium acetate buffered at a pH of 4.8.

Soil test P levels of <1 lbs P/acre are classified as very low. Between 1-3 lbs P/acre is low. Medium is between 4-8 lbs P/acre. High testing soils have P levels between 9 and 39 lbs P/acre and soils with >39 lbs P/acre are classified as very high. Of the home and garden samples, 41% tested low, 18% medium, 23% high and 18% tested very high. This meant that 41% tested high or very high in P.

Phosphorus levels for samples for commercial production in Franklin County were lower than the state average (50% tests high or very high in P). Only 3% tested very high. Twenty six percent was low in P, 33% tested medium while 38% of the submitted samples were classified as high in soil test P. This means that 41% tested high or very high in P and that for 97% of the fields sampled in the 6 year period there would have been a P recommendation for corn. There were no clear trends in P levels over the 6 years.

Classifications for potassium depend on soil management group. The fine-textured soils of soil management group 1 have a greater K supplying capacity than the coarse textured sandy soils (soil management group 5). Classification for each of the management groups in the above table represent very low, low, medium, high and very high. So for example for soil management group 5, <60 lbs K/acre means the soil is very low in K, between 60 and 114 lbs K/acre is low, 115-164 lbs K/acre is medium, 165-269 lbs K/acre is high and >269 lbs K/acre is classified as very high (see the table below).

Potassium classifications depend on soil test K levels and soil management group.

Soil Management Group	Potassium Soil Test Value (Morgan extraction in lbs K/acre)				
	Very low	Low	Medium	High	Very High
1	<35	35-64	65-94	95-149	>149
2	<40	40-69	70-99	100-164	>164
3	<45	45-79	80-119	120-199	>199
4	<55	55-99	100-149	150-239	>239
5 and 6	<60	60-114	115-164	165-269	>269

Of the home and garden samples, 20% were classified as very low in potassium. Twenty percent tested low, 13% medium, 29% high and 20% very high. For samples submitted for commercial production, 7% tested very low in K, 22% tested low, 23% medium, 24% high and 22% tested very high in potassium. As with phosphorus, there were no trends over the 6 years of soil sampling.

Soils test very low for magnesium if Morgan extractable Mg is less than 20 lbs Mg/acre. Low testing soils have 20-65 lbs Morgan Mg per acre. Soils with 66-100 lbs Mg/acre test medium for magnesium. High testing soils have 101-199 lbs Mg/acre while soils with more than 200 lbs Mg/acre in the Morgan extraction are classified as very high in Mg. Magnesium levels ranged from 10 to over 2000 lbs Mg/acre (Morgan extraction). There were only seven samples that tested very low in Mg. Of the 56 home and garden samples, 9 tested low, 3 were medium, 14 were high and 27 were very high in magnesium. Of the samples submitted for commercial production, most tested high or very high (93%).

Ketterings, Q.M., H. Krol, W.S. Reid and C. Tillinghast (2003). Franklin County Soil Sample Survey 1995-2001. CSS Extension Bulletin E03-11. 37 pages.

Soils with more than 50 lbs Morgan extractable Fe per acre test excessive for Fe. Anything lower than 50 lbs Fe/acre is considered normal. Iron levels fell for 89-95% in the normal range with 11% of the home and garden samples and 5% of the samples for commercial production testing excessive for Fe. Similarly, most soils (98-99%) for both groups tested normal for manganese. Soils with more than 100 lbs Morgan extractable Mn per acre are classified as excessive in Mn. Anything less than 100 lbs Mn per acre is classified as normal. Soils with less than 0.5 lbs Zinc per acre in the Morgan extraction are classified as low in Zn. Medium testing soils have between 0.5 and 1 lbs of Morgan extractable Zn per acre. If more than 1 lbs of Zn/acre is extracted with the Morgan solution, the soil tests high in Zn. For the home and garden samples, 79% tested high for zinc while 20% tested medium. Of the samples for commercial production, 1% tested low in zinc, 16% tested medium while 82% were high in zinc.

In the following sections, the summary tables for each of the soil fertility indicators described above are given. Because only 56 samples were submitted for home and garden production during 1995-2001, we did not present distribution percentages for each of the individual year but rather showed averages over the 6 year period. The Appendix contains the Cornell crop codes used in section 2.

Appendix: Cornell Crop Codes

Crop codes are used in the Cornell Nutrient Analyses Laboratory.

Crop Code	Crop Description
Alfalfa	
ABE	Alfalfa trefoil grass, Establishment
ABT	Alfalfa trefoil grass, Established
AGE	Alfalfa grass, Establishment
AGT	Alfalfa grass, Established
ALE	Alfalfa, Establishment
ALT	Alfalfa, Established
Birdsfoot	
BCE	Birdsfoot trefoil clover, Establishment
BCT	Birdsfoot trefoil clover, Established
BGE	Birdsfoot trefoil grass, Establishment
BGT	Birdsfoot trefoil grass, Established
BSE	Birdsfoot trefoil seed, Establishment
BST	Birdsfoot trefoil seed, Established
BTE	Birdsfoot trefoil, Establishment
BTT	Birdsfoot trefoil, Established
Barley	
BSP	Spring barley
BSS	Spring barley with legumes
BUK	Buckwheat
BWI	Winter barley
BWS	Winter barley with legumes
Clover	
CGE	Clover grass, Establishment
CGT	Clover grass, Established
CLE	Clover, Establishment
CLT	Clover, Established
CSE	Clover seed production, Establishment
CST	Clover seed production, Established

Crop Code	Crop Description
	Corn
COG	Corn grain
COS	Corn silage
	Grasses, pastures, covercrops
CVE	Crownvetch, Establishment
CVT	Crownvetch
GIE	Grasses intensively managed, Establishment
GIT	Grasses intensively managed, Established
GRE	Grasses, Establishment
GRT	Grasses, Established
PGE	Pasture, Establishment
PGT	Pasture improved grasses, Established
PIE	Pasture intensively grazed, Establishment
PIT	Pasture intensively grazed, Established
PLE	Pasture with legumes, Establishment
PLT	Pasture with legumes, Established
PNT	Pasture native grasses
RYC	Rye cover crop
RYS	Rye seed production
TRP	Triticale peas
	Small grains
MIL	Millet
OAS	Oats with legume
OAT	Oats
SOF	Sorghum forage
SOG	Sorghum grain
SOY	Soybeans
SSH	Sorghum sudan hybrid
SUD	Sudangrass
WHS	Wheat with legume
WHT	Wheat
	Others
ALG	Azalea
APP	Apples
ATF	Athletic Field

Crop Code	Crop Description
BDR/DND	Beans-dry
BLU/BLB	Blueberries
BRS	Broccoli-seeded
CEM	Cemetery
END	Endives
FAR	Fairway
FLA	Flowering annuals
GRA	Grapes
GEN	Green
HRB	Herbs
IDL	Idle land
LAW	Lawn
MIX/MVG	Mixed vegetables
PEP	Peppers
PER	Perennials
PRK	Park
POT/PTO	Potatoes
PUM	Pumpkins
ROD	Roadside
ROS	Roses
ROU	Rough
RSF	Raspberries, Fall
RSP	Raspberries (homeowners)
RSS	Raspberries, Summer
SAG	Ornamentals adapted to pH 6.0 to 7.5
SPF	Spinach, Fall
SPS	Spinach, Spring
SQW	Squash, Winter
STE	Strawberries, Ever
STR	Strawberries (homeowners)
STS	Strawberries, Spring
SUN	Sunflowers
SWC	Sweet corn
TOM	Tomatoes
TRE	Christmas trees, Established
TRF	Turf
TRT	Christmas trees, Topdressing
TUR	Turnips
